

GDP, household income and total employment in 2050 against the no-GIT (green iron trade) scenario, and which trade scenario delivers the better result → Fig. A

Agora Industry (2026). Each marker shows the difference against the no-GIT scenario in 2050, using whichever trade scenario delivers more. Left means mid-GIT delivers more, right means full-GIT delivers more, and distance from the centre shows the size of the result. Grey markers indicate countries where both trade scenarios' results are lower than in the no-GIT scenario; the value shown is the smaller shortfall. Total employment covers all five sectors as a share of employment in the no-GIT scenario. GIT = green iron trade
