Residual emissions in steel sector: Accelerated Decarbonisation scenario, 2050 → Fig. 22

Agora Industry (2026). Note: As concerns scope 1 emissions, for scrap-EAF we assume 0.05 tCO_2/t of crude steel and for EAF with HBI imports we assume 0.1 tCO_2/t of crude steel in 2050. For scope 2 emissions we assume 0.01 emissions from an almost fully decarbonized power grid.
